

GREEN ENERGY SYSTEMS

BIOMASS CHP PLANTS

GREEN ENERGY SYSTEMS Biomass CHP Plants

Today Green Energy Systems is proud with the largest experience in wood gasification in Baltic States, cogeneration station design, development of engineering solutions, equipment production, piping installation, montage and maintenance.

Cogeneration is a combined heat and electricity production. The biomass is converted into gas, so the CHP can provide a stable, autonomous and from the weather independent energy and heat supply. Used As feedstock is biomass - wood processing and logging by products - wood chips and wood waste separated from C & D or MSW streams. Cogeneration stations are used in industry, public and private sectors, including municipalities, that way successfully solving heat supply questions.

TECHNICAL DATA

MODEL	G45		G50		G70
ELECTRIC POWER	45 kWel		50 kWel		70 kWel
THERMAL POWER	103 kWth		110 kWth		123 kWth
FUEL	Size: G30 till G40 Water content: < 13 % Fine parts max. (< 4 mm) 30%				
FUEL CONSUMPTION*	0,9 KG/KWHEL	0,9 KG/KWHEL	0,9 KG/KWHEL	0,9 KG/KWHEL	
FLOW TEMPERATURE	85° C	85° C			
RETURN TEMPERATURE	60° C	65° C			

* Fuel consumption addicted from the quality of the wood chips, which used.
